

THREATLENS

THREAT INTELLIGENCE COMMAND CENTER

AI

Correlate alerts. Prioritise risk. Investigate faster.

IBM BoB AI Innovation Hackathon 2026

THREATFORGE

AI Track • Threat Intelligence Correlation & Alert Prioritisation

SOC / COMMAND

ALERTS 6

INCIDENTS 1

MCP TOOLS 5

EVIDENCE → DECISION

The Problem

Why security teams lose time before they can act

ALERT OVERLOAD

Multiple feeds produce duplicate, noisy and disconnected alerts.

MANUAL CORRELATION

Analysts must connect IPs, hosts, indicators and techniques by hand.

SLOW PRIORITISATION

Without context, genuine threats can look like isolated low-value events.

What the problem statement asks for

- Ingest multi-source threat feeds
- Correlate related alerts and reduce false positives
- Map evidence to MITRE ATT&CK
- Prioritise incidents and produce a concise investigation summary

CORE GAP

**Alerts are plentiful.
Actionable context is
not.**

The Solution

ThreatLens turns scattered alerts into an investigation-ready incident

One investigation surface

The analyst sees the evidence chain, not six disconnected notifications.

OUTCOME

Faster triage • clearer evidence •
focused response

Architecture

A modular pipeline from alert ingestion to AI-assisted investigation

DATA SOURCES

EDR / SIEM / IDS / Threat Feeds

INGESTION API

FastAPI • Normalize • Validate

CORRELATION ENGINE

Entity overlap • Risk scoring • Incident creation

SECURITY CONTEXT

MITRE ATT&CK • Indicators • Investigation evidence

AI / AGENT LAYER

IBM Bob ↔ ThreatLens MCP Server

PRESENTATION

React + Vite • Dashboard • Reports

LOAD-BEARING IBM INTEGRATION

Demo Flow

A repeatable end-to-end scenario for the working prototype

SIMULATE

Generate a multi-source attack pattern

CORRELATE

6 alerts → 1 correlated incident

PRIORITISE

Rank by severity, risk and evidence

INVESTIGATE

Open incident context + MITRE mapping

BOB + MCP

Query live incident evidence through tools

BLUF

Return concise findings + recommended actions

DEMO SUCCESS SIGNAL the same incident is visible in the dashboard, API and Bob investigation flow.

IBM BoB

AI coding / investigation agent

- Uses the repository's .bob/mcp.json configuration
- Can call ThreatLens MCP tools during investigation
- Gets live incident and evidence context instead of static demo text

THREATLENS MCP SERVER

get_incident

get_correlated_alerts

get_investigation

search_indicator

get_mitre_coverage

Bob asks → MCP tools retrieve → evidence returned → investigation answer

Results & Impact

Prototype results from the repeatable demo scenario

6

alerts generated

1

correlated incident

5

MCP investigation tools

1

BLUF investigation output

What this demonstrates

- Correlation is visible and explainable
- Prioritisation is tied to evidence
- MITRE context is attached to the investigation
- Bob can consume the live security context through MCP

IMPORTANT

These are prototype demo metrics — not production performance benchmarks.
